

Harmonic Signals and Elementary Operations

Exercise 1:

A harmonic signal has the form:

$$y(t) = A \cos(\omega t + \phi)$$

In this, A , ω and ϕ are parameters.

Note: Plot the graphs of exercises A) and E) in one figure using the `subplot(2,1,1)` and `subplot(2,1,2)` commands respectively.

For $A = 1$, $\omega = 2\pi f$ with $f = 5 \text{ Hz}$ and $\phi = 0 \text{ rad}$,

- A) Plot the signal $y(t)$ using a time vector ranging from 0 to 1 second that has 200 time steps per period of $y(t)$.
- B) What is the effect of A in $y(t)$? (Vary this parameter in the code to see the effect)
- C) What is the effect of ω in $y(t)$? (Vary this parameter in the code to see the effect)
- D) What is the effect of ϕ in $y(t)$? (Vary this parameter in the code to see the effect)

In essence, our answer in A) is a discretization of the signal $y(t)$. However, it is plotted versus nT_s instead of versus n . Moreover, the sample time T_s is taken so small that it looks as if it's a continuous-time signal. You can see this by plotting markers using "`plot(t,y,'-x')`". The marker `'-x'` can be replaced by a variety of other markers: `'-o'`, `'-.'`, `'-s'`, etc.

For $A = 1$, $\omega = 2\pi f$ with $f = 5 \text{ Hz}$ and $\phi = 0 \text{ rad}$,

- E) Plot $y[n]$, the discrete version of $y(t)$, versus n with $\Omega = \frac{1}{10} * 2\pi$ using the `stem(x,y)` command. Make sure you choose n such that the domain in continuous time is $0 \leq t \leq 1 \text{ s}$.
- F) What is the sample time T_s in E)?

Using:

$$\begin{aligned}x_1(t) &= 0.5 \cos\left(2\pi 5t + \frac{1}{4}\pi\right) \\x_2(t) &= 0.3 \cos(2\pi 10t)\end{aligned}$$

- G) What is A in x_1 ?
- H) What is ϕ in x_2 ?
- I) What is ω in x_1 ?
- J) What is the period of x_2 ?

Assume now that we sample with a sample frequency of 7 Hz , which leaves us with $x_1[n]$ and $x_2[n]$.

$$\begin{aligned}x_1[n] &= 0.5 \cos\left(\frac{10\pi}{7}n + \frac{1}{4}\pi\right) \\x_2[n] &= 0.3 \cos\left(\frac{20\pi}{7}n\right)\end{aligned}$$

Exercise 1

Task A

```
A=1;
```

```
f=5;
```

```
fi=0;
```

```
w=2*pi()*f;
```

```
t=linspace(0,1,200);
```

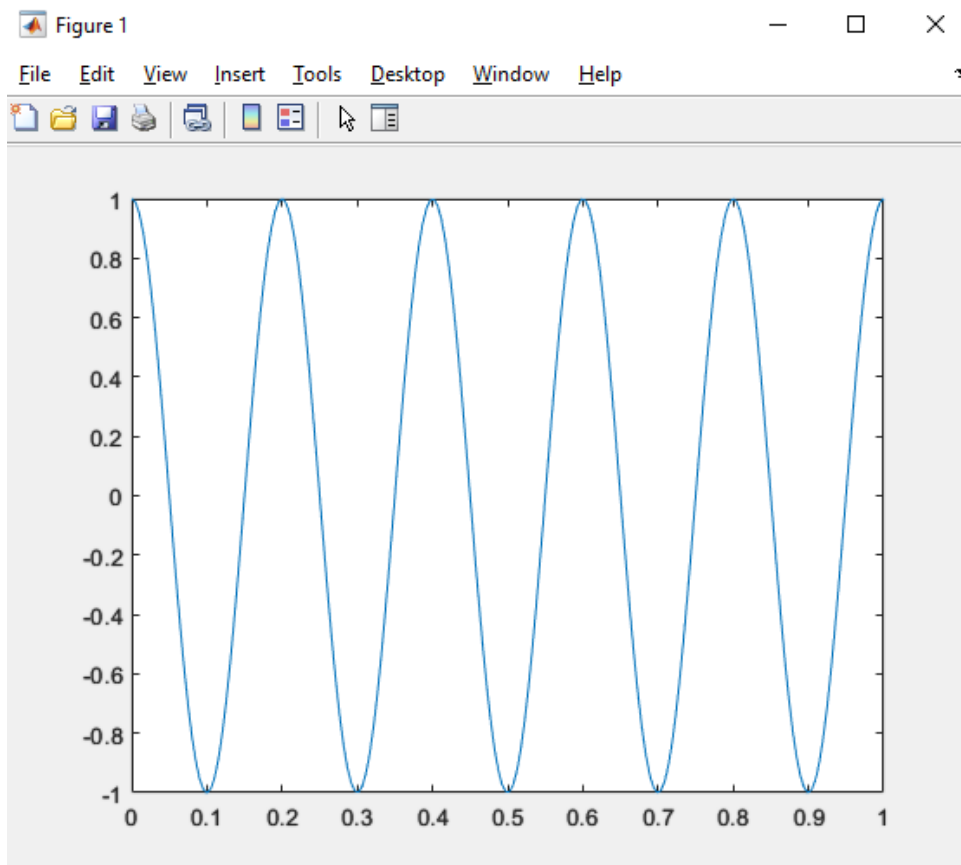

```
for ii=1:length(t)
```

```
    y(ii)=A*cos(w*t(ii)+fi);
```

```
end
```

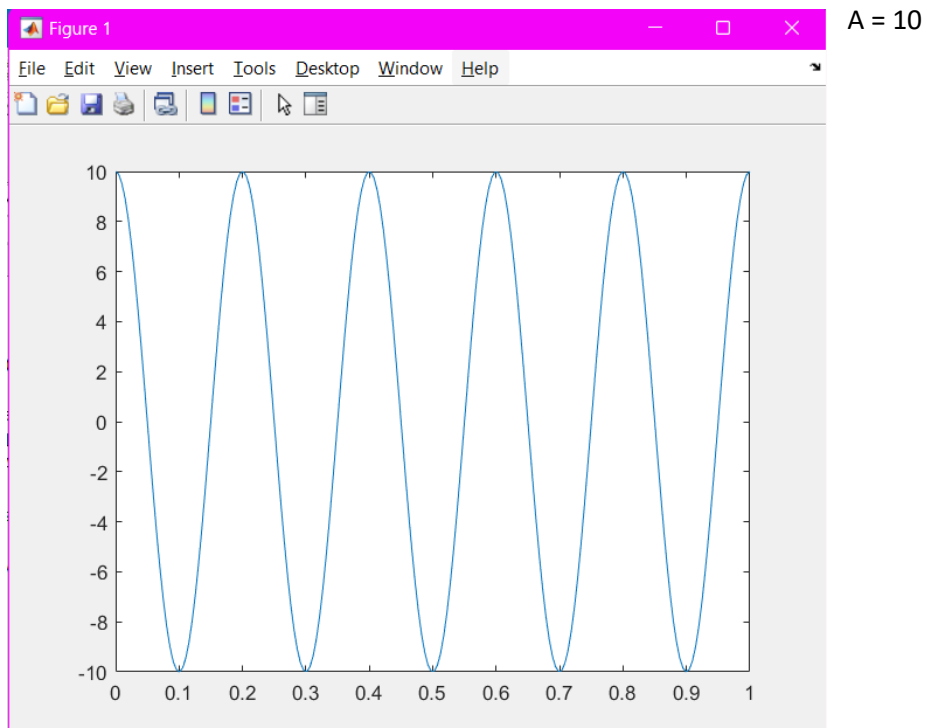

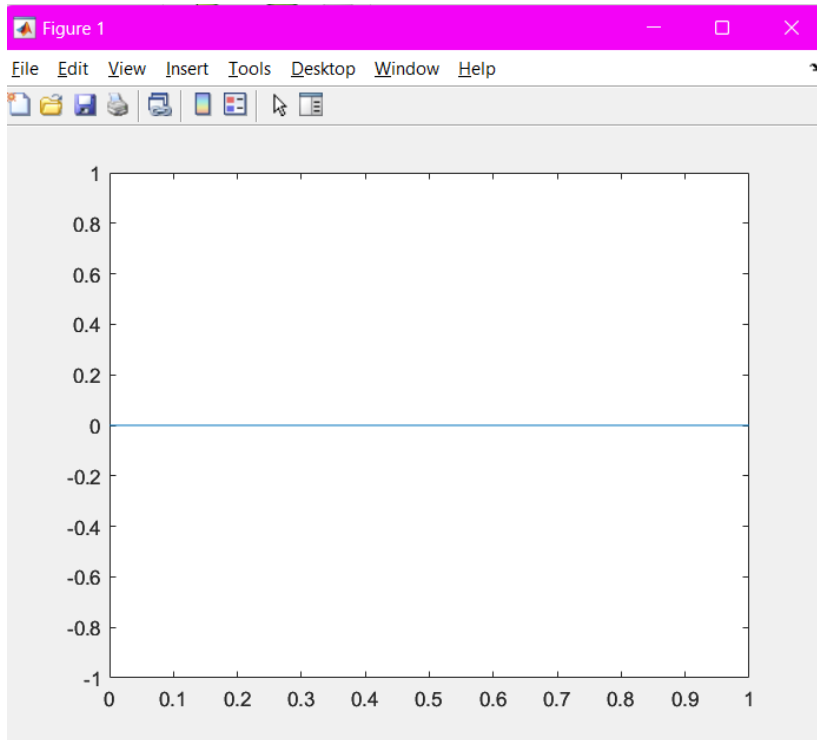

```
%y=A*cos(w*t+fi); (Another solution to make a graph)
```

```
plot(t,y)
```

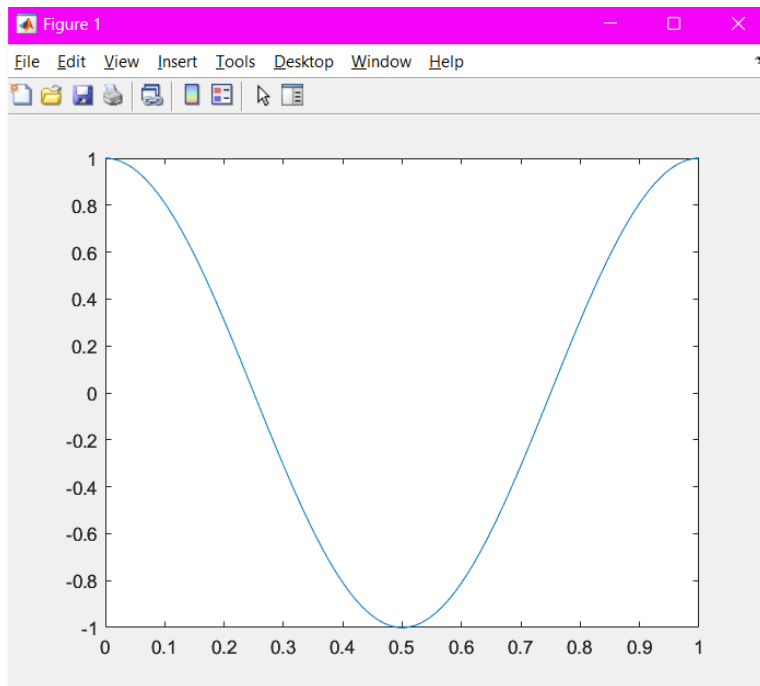

Task B

$A = 0$

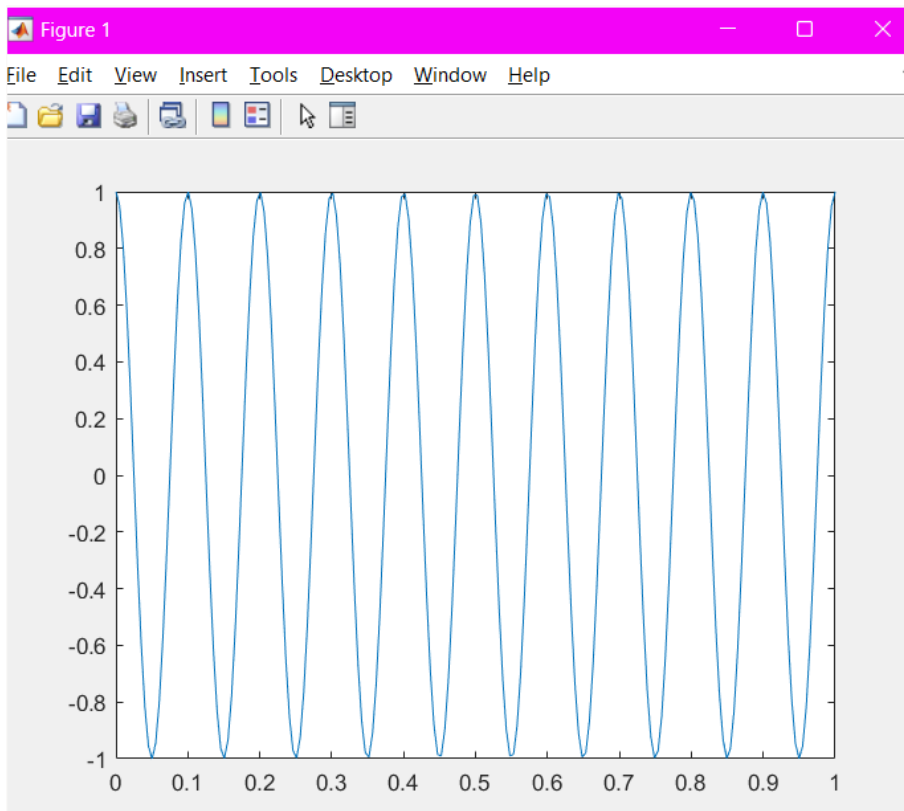

If you change A , then Y axis increases, amplitude becomes higher.

Task C

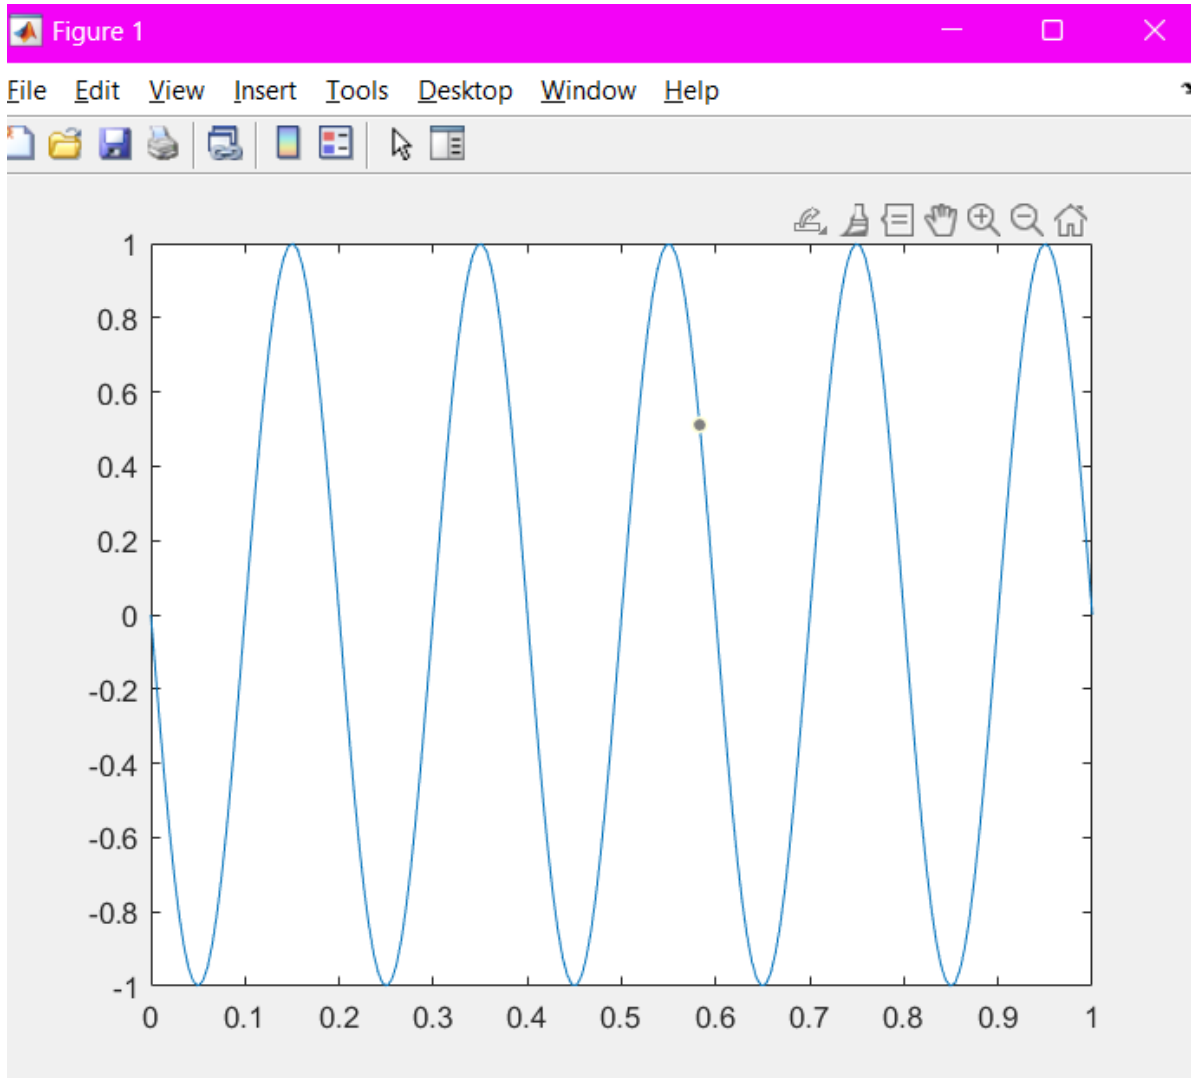

$W=6.28$ if $f = 1$

If you change f , then ω also changes and if ω is changed, then period of the graph decreases (is decreasing). Check the graph under, in this case $\omega(\omega) = 62.83$, $f = 10$ Hz

Task D

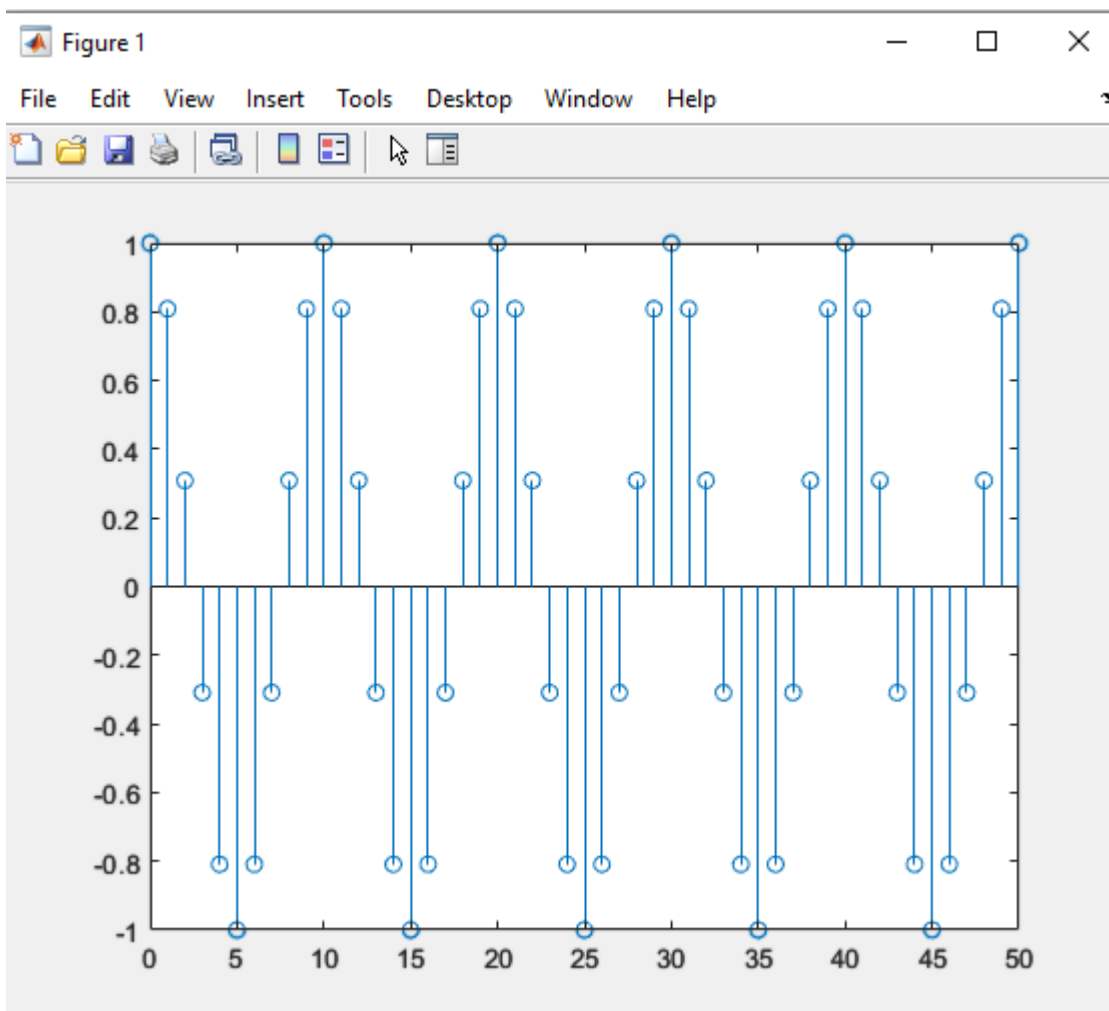

If you change ϕ , then graph shifts on horizontal axis making phase shifts.

In this case graph f_i is $\pi/2$, so graph shifts for 90 degrees from Task A graph.

Task E

```
t=linspace(0,1,201);  
%t=0:1;  
A=1;  
f=5;  
fi=0;  
w=2*pi()*f;  
W=((1/10)*2*pi());  
Ts=(W/w);  
n=(t./Ts);  
n1=round(n);  
N=unique(n1);  
y=A*cos(W*N+fi);  
stem(N,y)
```

Task F

Sample time $T_s = 0.02$ s

Tasks G, H, I, J

G) $A = 0,5$

H) $\phi_i = 0$ degrees

I) $\omega = 2\pi \cdot 5$

J) $\omega = 2\pi/T \rightarrow 2\pi \cdot 10 = 2\pi/T \rightarrow T = 1/10 = 0,1$ s

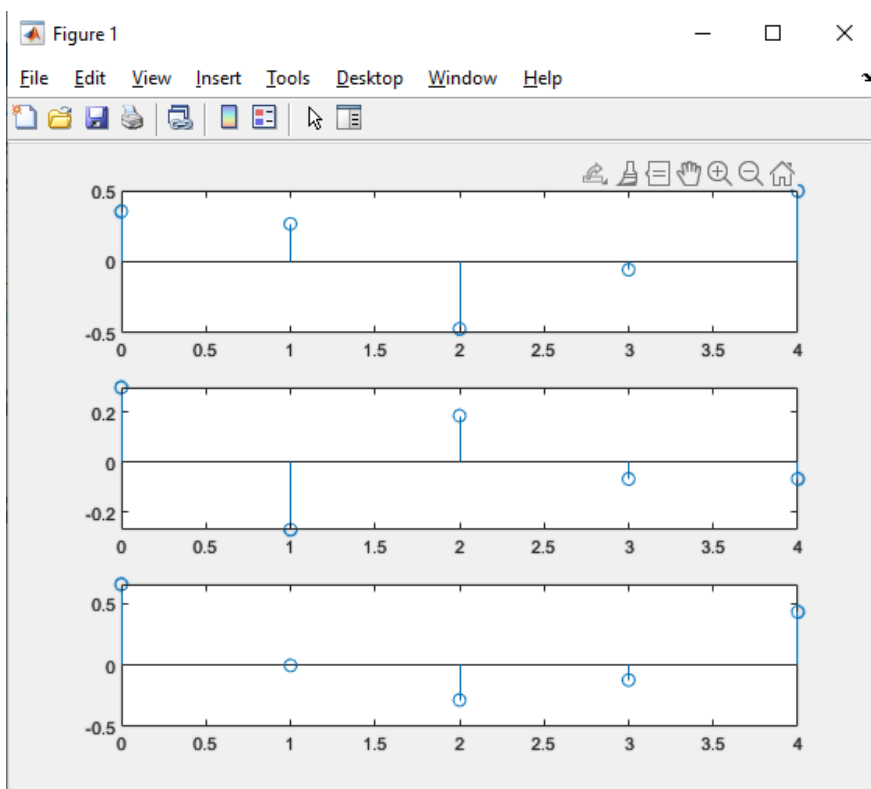

Exercise 2

Tasks K and L

```
n=0:4;  
subplot(3,1,1);  
x1=0.5*cos(((10*pi)/7)*n+(1/4)*pi);  
stem(n,x1)
```

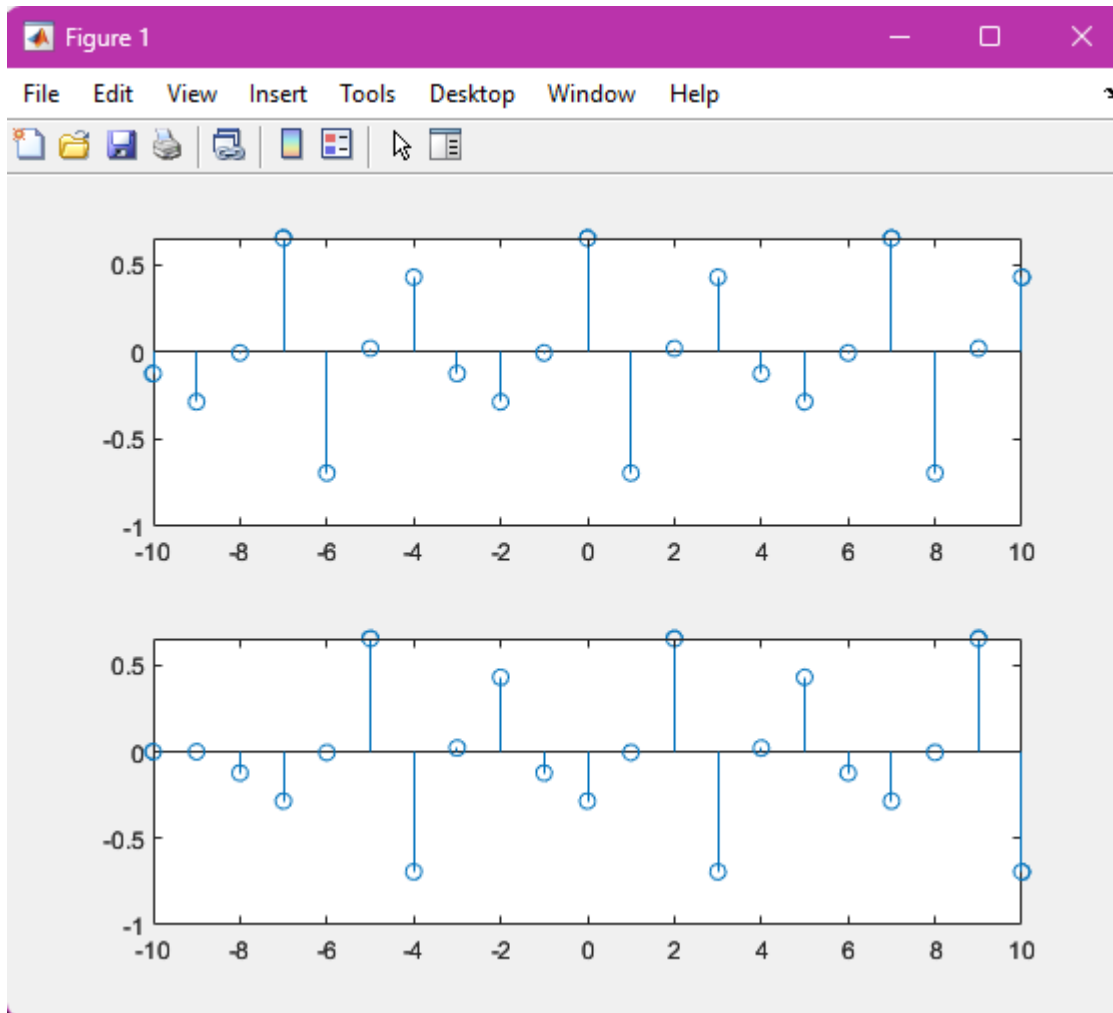

```
subplot(3,1,2);  
x2=0.3*cos(((20*pi)/7)*n);  
stem(n,x2)
```

```
subplot(3,1,3); %sum  
x3=x1+x2;  
stem(n,x3)
```

Task M

```
n=-10:10;  
i=find((n>=0)&(n<=4));  
i=1:length(n);  
  
x1=0.5*cos(((10*pi)/7)*n+(1/4)*pi);  
x2=0.3*cos(((20*pi)/7)*n);  
x3=x1+x2;  
  
x4=x3(end:-1:1);  
for k=3:length(n)  
    x5(k)=x4(k-2);  
end  
  
subplot(2,1,1); %mirror  
stem(n(i),x4(i))  
subplot(2,1,2); %delay  
stem(n(i),x5(i))
```

Exercise 3

Exercise 3

2nd order form $\Rightarrow \frac{\omega_n^2}{s^2 + 2\beta\omega_n s + \omega_n^2}$

$$a) H(s) = \frac{1}{s^2 + 0.01s + 1}$$

$$|H(j\omega)| = \frac{1}{\sqrt{(1-\omega^2)^2 + (0.01\omega)^2}}$$

$$\omega \rightarrow 0: |H(0)| = \frac{1}{\sqrt{(1-0)^2 + (0.01 \cdot 0)^2}} = \frac{1}{\sqrt{1}} = 1 \rightarrow 0 \text{ dB}$$

$$\omega \rightarrow \infty: |H(\infty)| = \frac{1}{\sqrt{(1-\infty)^2 + (0.01\infty)^2}} = \frac{1}{\sqrt{\infty}} \approx 0 \rightarrow -\infty \text{ dB}$$

$$\omega_n^2 = 1 \Rightarrow \omega_n = \sqrt{1} = 1$$

$$\omega \rightarrow \omega_n \Rightarrow |H(\omega_n)| = \frac{1}{\sqrt{(1-1)^2 + (0.01 \cdot 1)^2}} = \frac{1}{\sqrt{0^2 + 0.01^2}} = \frac{1}{0.01} = 100 \rightarrow 40 \text{ dB}$$

$$b) \omega_n^2 = 1 \Rightarrow \omega_n = \sqrt{1} = 1$$

Magnitude of ω_n is 40 dB, that can be seen above.
